CMS

And further on *WordPress*

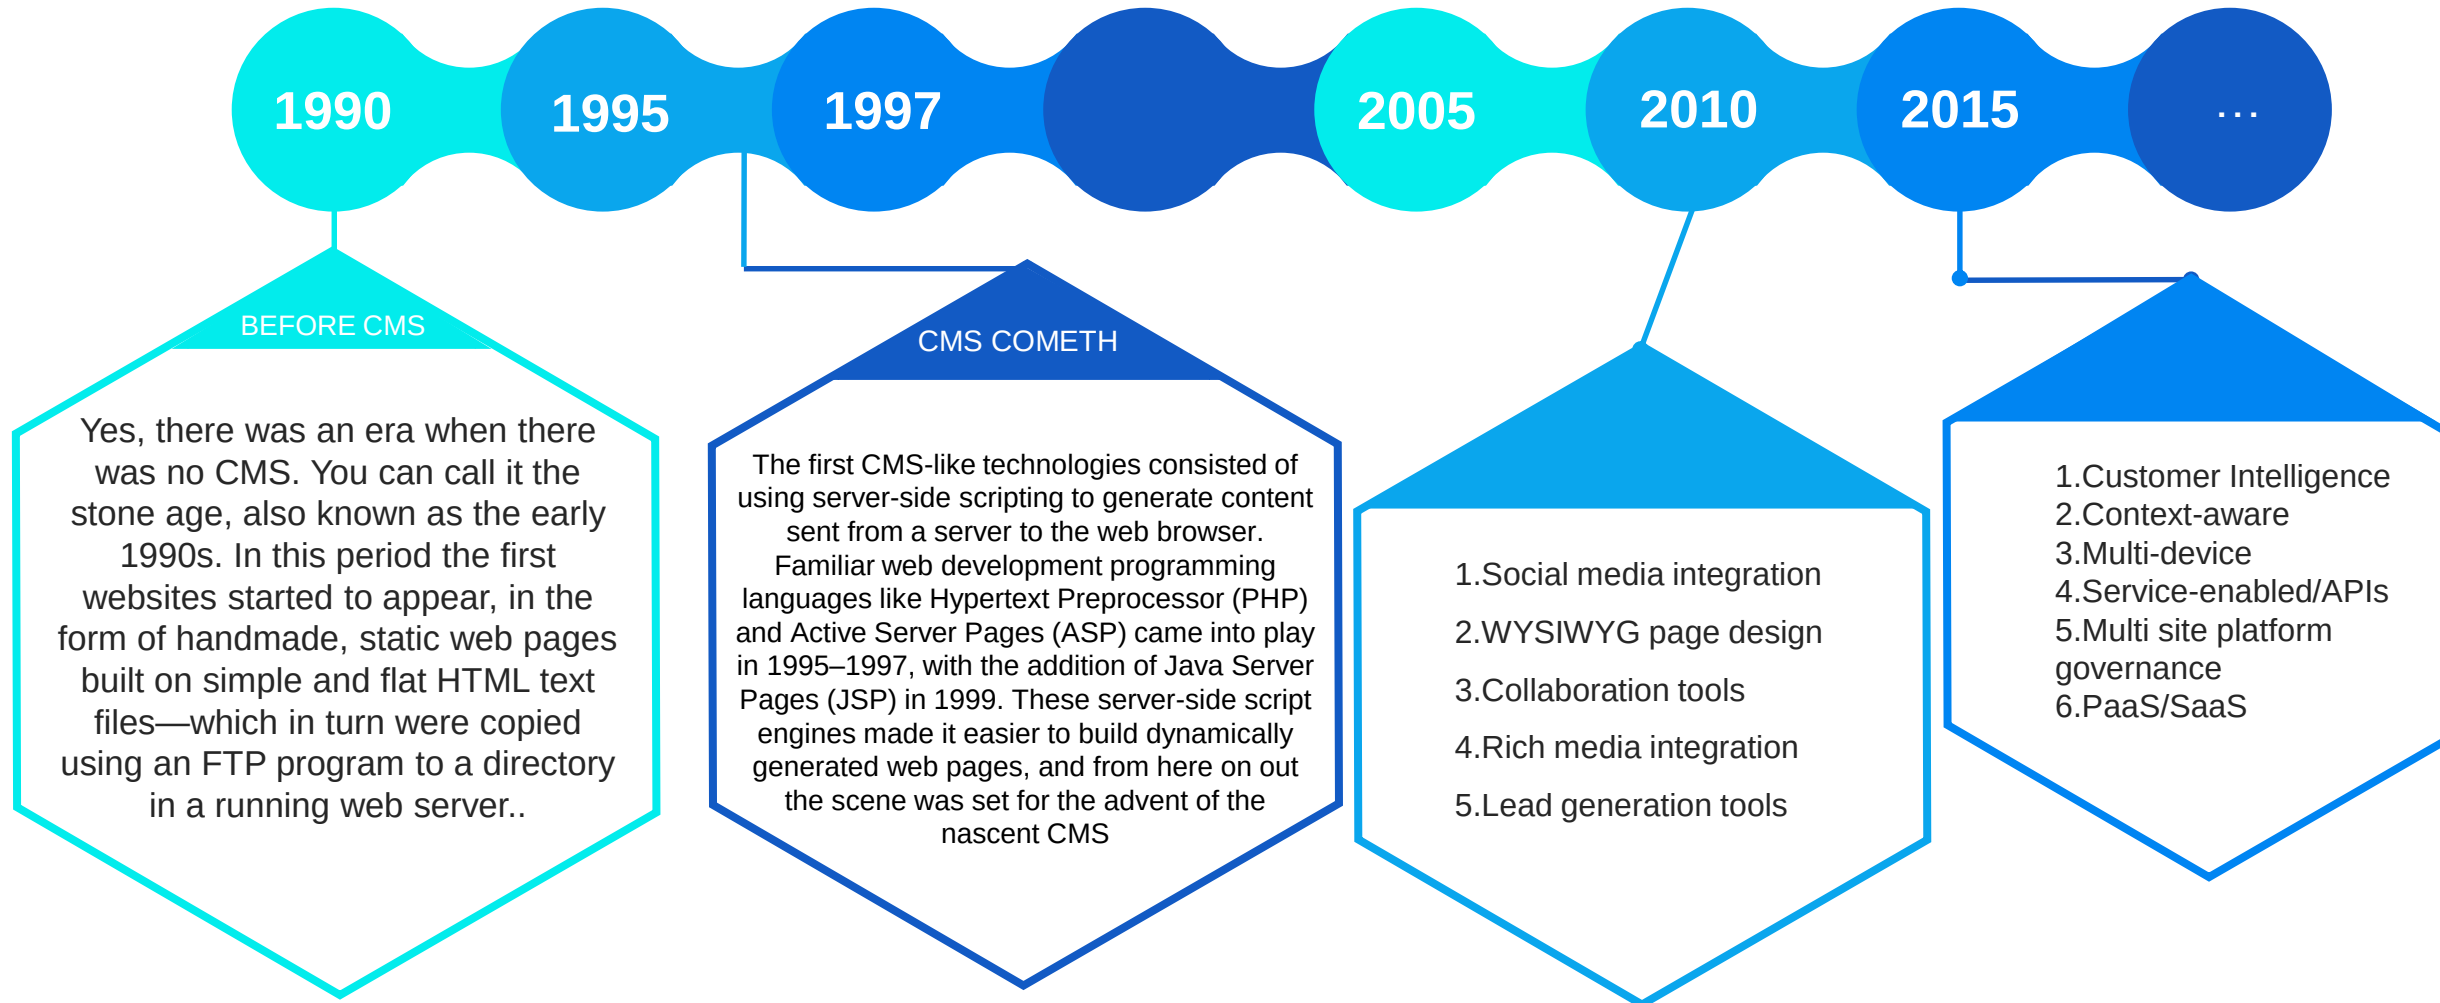

Definition of CMS

A content management system (CMS) is a software application that enables users to create, edit, collaborate on, publish and store digital content. CMSes are typically used for enterprise content management (ECM) and web content management (WCM).

content management system, is a software application that allows users to build and manage a website without having to code it from scratch, or know how to code at all. With a CMS, you can create, manage, modify, and publish content in a user-friendly interface.

Evolution of CMS

Difference between WCM & ECM

WCM

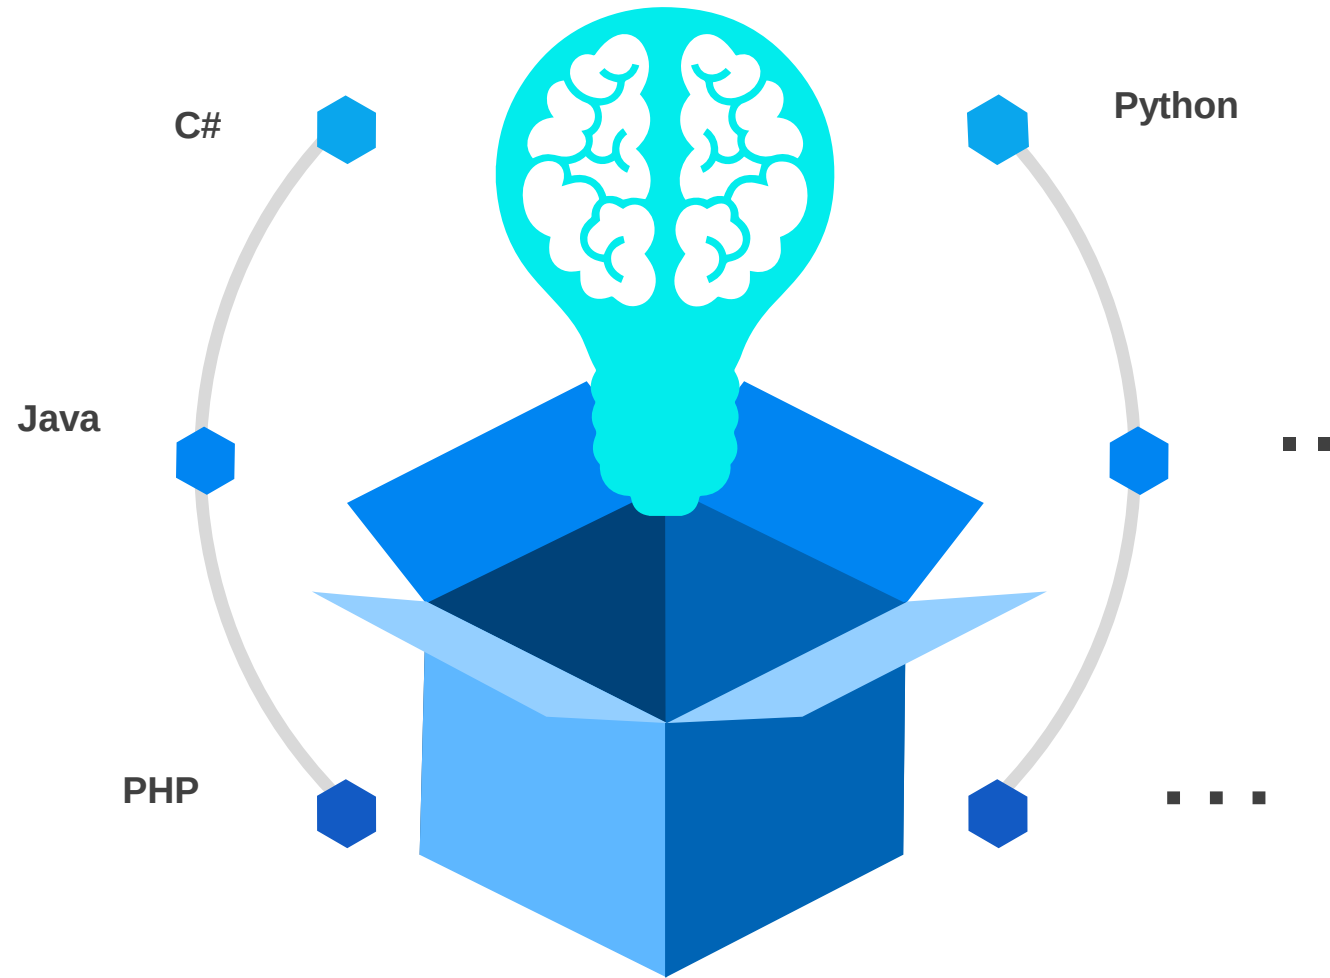

- Manages multiple types of content.
- Externally oriented
- Supports content delivery for customer –facing engagement.
- Includes content delivery capabilities.
- Morphs into digital experience management.

VS

ECM

- Manage unstructured information.
- Focus on content Production.
- Content Delivery is done through apps.
- Supports workflow and content categorization capabilities.
- Stores digital files in nested folders.

WordPress

WordPress is known for its ease of use and flexibility for both developer and end user and is by far the most popular open source CMS. Unlike Drupal, it is quite easy to learn the basics of WordPress especially if your requirements don't involve complex customization. If they do, an experienced developer should be able to customize WordPress to allow it to complete most custom functions. The beauty of WordPress is that it has a very large and active community which means that you can often find third party plugins that allow you to achieve your goals. WordPress has no localization support or functionality out of the box but there are free (and paid) plugins that you can install to accommodate for this.

Joomla is often thought as the bridge between WordPress and Drupal in terms of complexity and ease of use. Joomla has strong E-commerce and social networking capabilities out of the box, which makes it a popular choice for users who require this kind of functionality. Unlike WordPress, Joomla does have some localization capabilities out of the box and it is easier to implement machine type translations such as Google Translate (which is generally not a viable solution if you require professional translations.)

Drupal

Drupal is the most powerful CMS of the three but also has the highest learning curve. Drupal is excellent if you require a highly customized website with advanced functionality and have advanced development capabilities at your disposal. While it has the most power it is also the most lightweight CMS (which can change depending on which plugins you decide to use) meaning that load times are faster with a base Drupal installation in comparison to WordPress or Joomla. Drupal also has a high level of localization functionality and options out of the box in addition to plugins that can aid with translation.

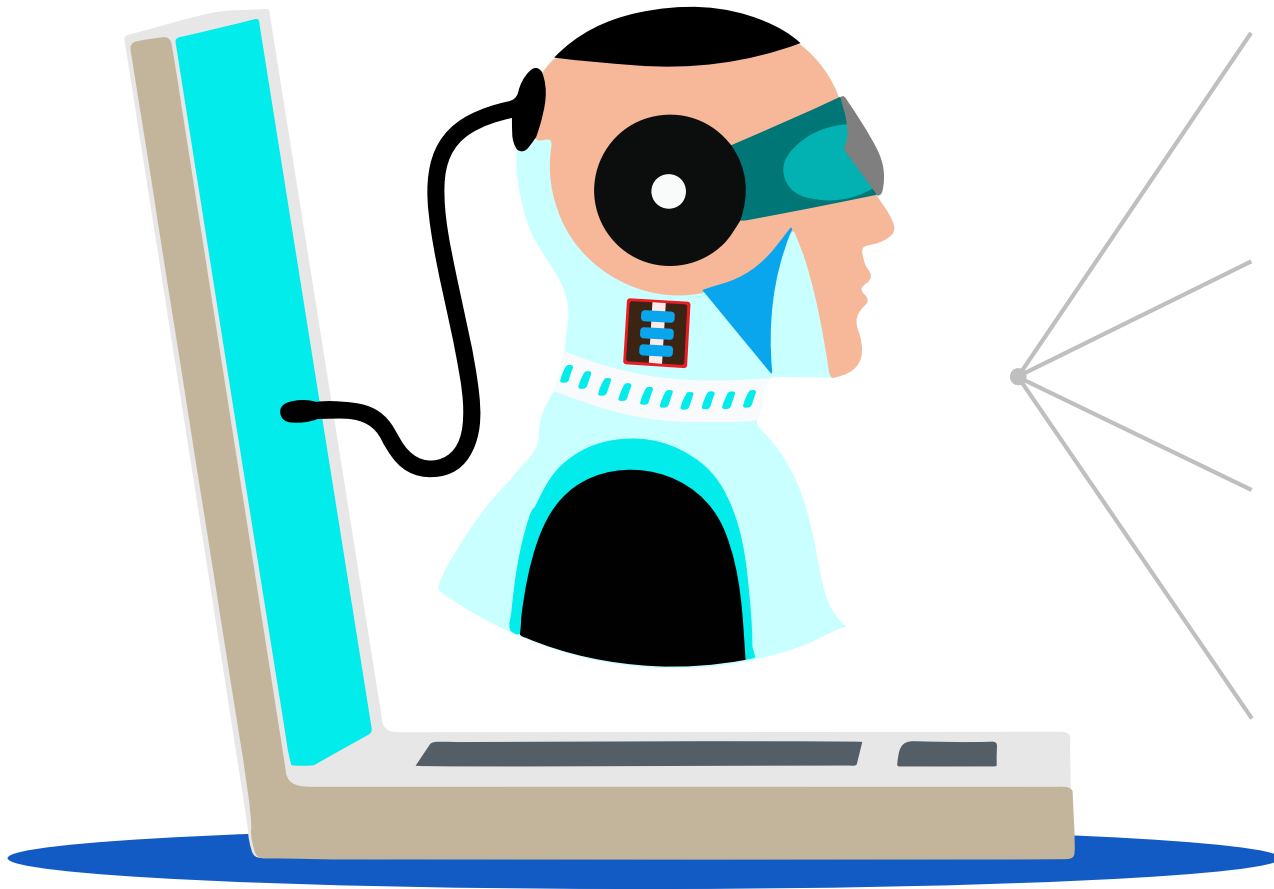

Which one is better ?

	WordPress	Joomla	Drupal
Release Date	2003	2005	2001
Download	140 million	63 million	15 million
Price	Free	Free	Free
Free Template	+4000	+1000	+2000
Free Plugin	+44000	+7000	+37000

Which one is better ?

	WordPress	Joomla	Drupal
Installation Time	Less than 5 minute	Less than 10 minute	Less than 10 minute
Simplicity	1	2	3
Update	Every 40 days	Every 36 days	Every 55 days
Appropriate for	All Types of Websites	Shopping Websites	All Types of Websites

Comparison

Better Situation in terms of templates & plugins

WordPress

Support

WordPress, Joomla

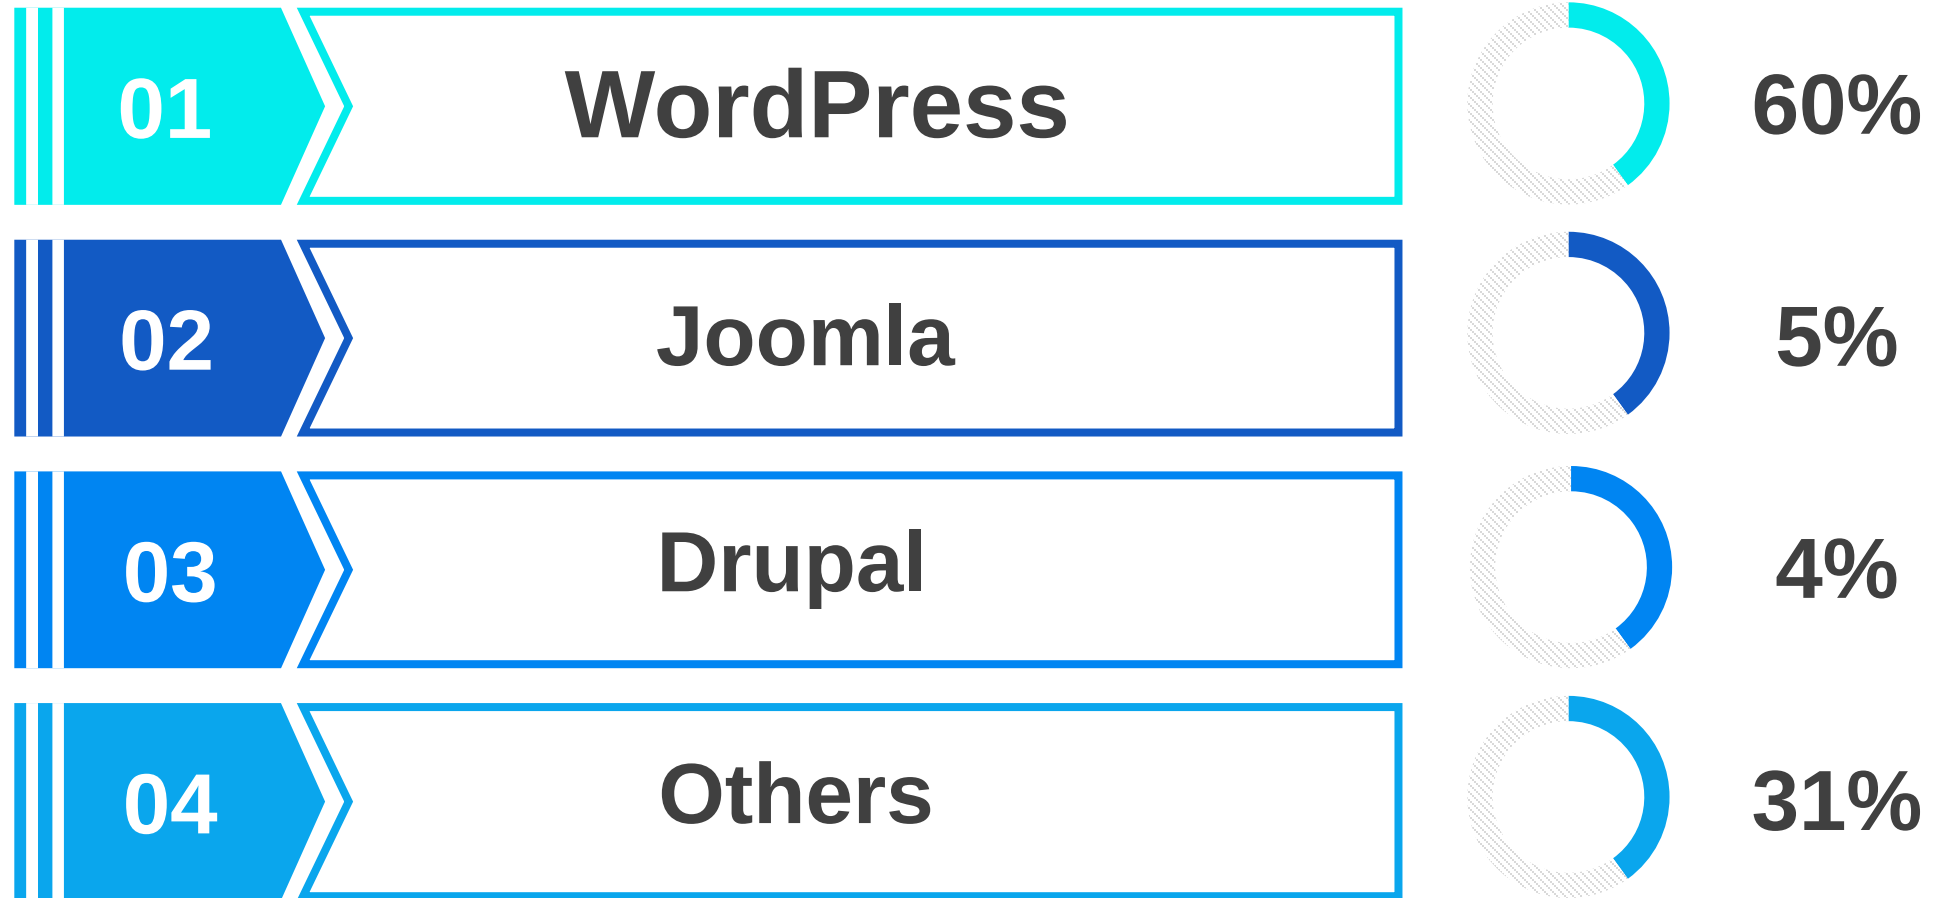

Multilingual Support

WordPress, Joomla, Drupal

Safety

WordPress, Joomla, Drupal

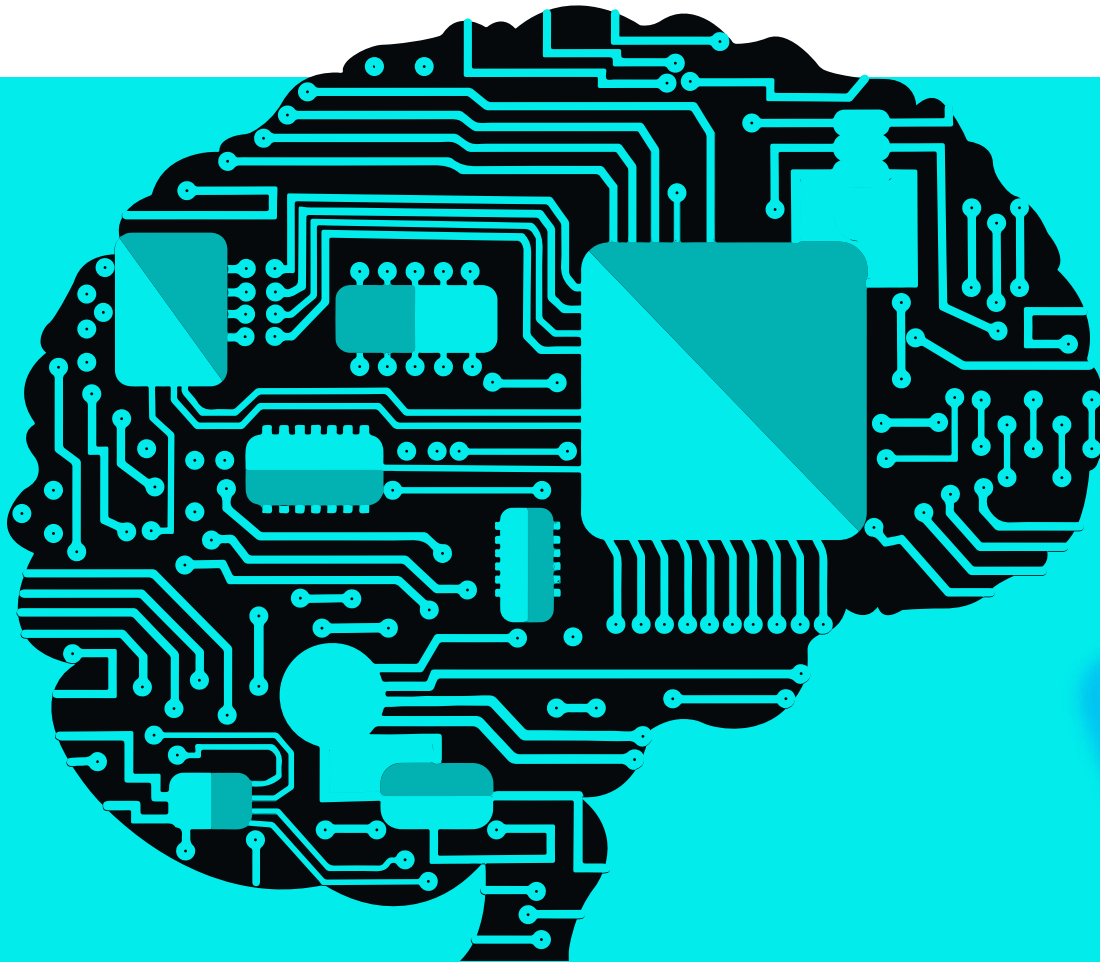

Percentage Usage of Different CMSeS

In conclusion we must mention that all these 3 have almost the same price & accessibilities. But with a closer look, we see that Joomla & Drupal give a higher level of accessibilities to the developers, which make them more efficient. Instead WordPress eliminate these deficiencies with more plugins.

Question: What coding language does WordPress use?

WordPress relies on two *declarative* languages, HTML and CSS; and on two *programming* languages, JavaScript and (especially) PHP.

php

PHP (recursive acronym for PHP: Hypertext Preprocessor) is a widely-used open source general-purpose scripting language that is especially suited for web development and can be embedded into HTML.
